

Assignment 2 Ihor Kozak

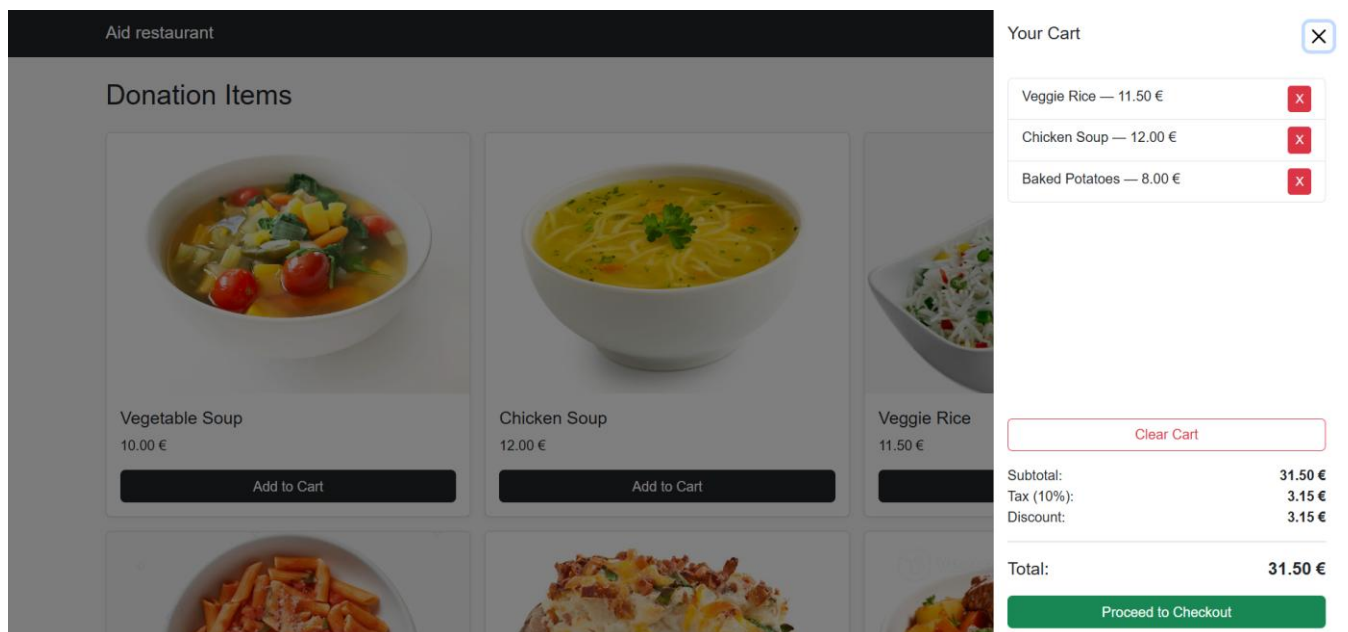

This project is a donation shop website created for Aid Restaurant. The goal of the application is to allow users to browse different meals, add them to a shopping cart, and complete a donation-based checkout process. The project is made using HTML, CSS, JavaScript, and Bootstrap 5, and it uses several Bootstrap components to build a clean and responsive user interface. The website begins with a welcome page that contains a background image, a title, a short message, and a button that takes the user to the main shop.

After pressing the “Start Ordering” button, the user is taken to the main shop section. Here, all products are displayed using Bootstrap Cards that contain an image, product title, price, and an “Add to Cart” button. Each product is generated dynamically using JavaScript by looping through an array of product objects. These cards are arranged using the Bootstrap grid system with “row” and “col-md-4”, allowing three cards per row on medium and larger screens.

The navigation bar at the top is created using the Bootstrap Navbar component. It displays the site name and includes a button to open the shopping cart. The cart itself is built using the Bootstrap Offcanvas component, which slides in from the right side. Inside the cart, a Bootstrap List Group is used to display added items, each containing the product name, price, and a button to remove it. The cart also shows the subtotal, tax, discount, and total.

The user can clean the entire cart with a “Clear Cart” button or proceed to checkout using a Bootstrap success button. When the user clicks “Proceed to Checkout,” JavaScript hides the product section and displays a checkout form. The form uses Bootstrap form controls to display fields for name, email, phone, address, and ZIP. JavaScript validates the form by checking if the

email contains “@”, the phone number contains only digits, and the ZIP code is no longer than six characters. If validation fails, an alert message appears.

When the user submits the form successfully, a text message “Thank you for ordering!” appears above the form, and then the confirmation page is displayed. The confirmation page shows the user’s name, email, address, and the final total price after tax and discount calculations. It also includes a button that returns the user to the shop. The calculations for subtotal, tax, discount, and total are all done with pure JavaScript. The discount of 10% appears automatically if the user has three or more items in the cart.

JavaScript is used to dynamically generate products, manage the shopping cart, calculate totals, validate form input, navigate between sections, and display a confirmation message. CSS is used

to style the background of the welcome page by adding a dark overlay to make the title stand out and to add shadows to product cards to improve the visual design. The website is fully responsive and works across different screen sizes due to the included Bootstrap system.
